

# Adjustment of photovoltaic power generation and energy storage ratio

What determines the optimal configuration capacity of photovoltaic and energy storage?

The optimal configuration capacity of photovoltaic and energy storage depends on several factors such as time-of-use electricity price, consumer demand for electricity, cost of photovoltaic and energy storage, and the local annual solar radiation.

How can a photovoltaic energy storage system provide efficient frequency support?

To ensure that the photovoltaic energy storage system provides efficient frequency support and power oscillation suppression, the virtual inertia and virtual damping parameters of the VSG should be coordinated based on system frequency safety and damping ratio constraints.

What is the optimal capacity allocation model for photovoltaic and energy storage?

Secondly, to minimize the investment and annual operational and maintenance costs of the photovoltaic-energy storage system, an optimal capacity allocation model for photovoltaic and storage is established, which serves as the foundation for the two-layer operation optimization model.

What is the minimum inertia demand of a photovoltaic energy storage system?

In a regional power grid, based on the operating conditions and system model, if the estimated disturbance power does not exceed 10 % of the total capacity, i.e.,  $P_d = 0.1pu$ , the minimum inertia demand of the photovoltaic energy storage system can be obtained in this case, when the maximum allowable rate of change of frequency is set. Fig. 2.

What is the energy storage capacity of a photovoltaic system?

The photovoltaic installed capacity set in the figure is 2395kW. When the energy storage capacity is 1174kWh, the user's annual expenditure is the smallest and the economic benefit is the best. Fig. 4. The impact of energy storage capacity on annual expenditures.

How to optimize PV output?

The PV output is therefore highly sufficient. The optimization process primarily entails a comparison of the rolling forecast and actual values, intending to further optimize the charging and discharging strategies of the energy storage and the power purchase and sale strategies of the users.
