Can lithiated nickel manganese cobalt oxide be produced by co-precipitation?

A process model has been developed and used to study the production process of a common lithium-ion cathode material, lithiated nickel manganese cobalt oxide, using the co-precipitation method. The process was simulated for a plant producing 6500 kg day⁻¹.

How much does cobalt cost in 2022?

For example, the price of cobalt has fallen from roughly \$70,000 per metric ton in 2022 to about \$30,000 in 2024. Similarly, the price for lithium carbonate has fallen from a high of approximately \$70,000 per metric ton to well below \$15,000 in 2024.

How is lithium nickel manganese cobalt oxide powder produced?

Schematic of a process for the production of lithium nickel manganese cobalt oxide powder. The product stream, a slurry of solid precipitates in a solution, is phase separated, and then filtered and washed several times. The filtration may be done in a rotary vacuum filter followed by drying in a spray dryer.

Are lithium and cobalt prices market-reflective?

This includes benchmark prices for lithium and cobalt, two battery materials that continue to experience market volatility and supply/demand imbalances. Our widely used prices are market-reflective, assessing both the buy- and sell-side of transactions.

How much will NMC cathode material cost?

This combination of changes indicates the possibility of the NMC cathode material price approaching \$20 per kg, or 19% less than the base case scenario. There are yet other cost-cutting measures that can drive the cost down even further. Fig. 6.

Why are cobalt prices consolidated?
