Can lithiated nickel manganese cobalt oxide be produced by co-precipitation?

A process model has been developed and used to study the production process of a common lithium-ion cathode material, lithiated nickel manganese cobalt oxide, using the co-precipitation method. The process was simulated for a plant producing 6500 kg day⁻¹.

How is lithium nickel manganese cobalt oxide powder produced?

Schematic of a process for the production of lithium nickel manganese cobalt oxide powder. The product stream, a slurry of solid precipitates in a solution, is phase separated, and then filtered and washed several times. The filtration may be done in a rotary vacuum filter followed by drying in a spray dryer.

Why are nickel-metal hydride batteries expensive?

Nickel-metal hydride batteries exhibit relatively high raw material cost due to large amounts of nickel. These batteries are also subject to commodity price fluctuations of nickel, leading to pack cost of 250 USD/kWh in the worst case.

What is the price spread of nickel sulfate compared to other raw materials?

The data show a price spread of more than 800% for the Li-compounds and almost 300% for cobalt during the time analyzed. During the post-pandemic recovery, nickel sulfate showed a narrower price spread compared to other raw materials.

Why are cobalt prices consolidated?

In the weeks following confirmation that the cobalt market will face an additional three months of no exports from the Democratic Republic of Congo (DRC), metal prices have consolidated as participants point to the future for bullish sentiment.
