Are dynamic models useful for storing CO<sub>2</sub> in liquid state?

4. A comparison with a simplified dynamic model In the last section, it has been seen that the most studied CCES are those storing CO<sub>2</sub> in liquid state in the low-pressure storage and that dynamic models are crucial to better understand the real process. However, the few dynamic studies proposed in the literature are only for gaseous storages.

How efficient is a liquid CO<sub>2</sub> energy storage system?

In comparing the system's RTE (65.3%) with similar LCES studies, we note that Zheng reported 56.12% efficiency for a liquid CO<sub>2</sub> energy storage system based on two-stage cold and heat storage, while Wan achieved 61.83% efficiency in a liquid carbon dioxide energy storage system, validating our design's competitiveness.

What is compressed carbon dioxide energy storage (CCES)?

They are now characterized as large-scale, long-lifetime and cost-effective energy storage systems. Compressed Carbon Dioxide Energy Storage (CCES) systems are based on the same technology but operate with CO<sub>2</sub> as working fluid. They allow liquid storage under non-extreme temperature conditions.

Why is liquid carbon dioxide energy storage a research hotspot?

Multiple requests from the same IP address are counted as one view. With the large-scale grid connection of renewable energy and the surge of peak power system demand, liquid carbon dioxide energy storage technology has become a research hotspot due to its high energy density and environmental friendliness.

Can gasbag-structured compressed supercritical carbon dioxide energy storage be used for ancillary services?

To address these challenges, gasbag-structured compressed supercritical carbon dioxide energy storage (G-CSCES) has been developed. However, existing studies primarily focus on exergoeconomic optimization, and current cavern-structured CAES models are not applicable to G-CSCES, hindering its use for ancillary services.

Is liquid storage a viable solution for CCES storing CO<sub>2</sub> below ambient temperature?

The use of aboveground tanks limits CCES to smaller storage volumes. Consequently, liquid storage appears as a promising solution. There is a major change with aboveground CCES storing CO<sub>2</sub> below ambient temperature: the need for a cold thermal storage.
