What is the US energy storage monitor?

A few tips before you get started... The US Energy Storage Monitor is a quarterly publication of Wood Mackenzie Power & Renewables and the American Clean Power Association (ACP). Each quarter, new industry data is compiled into this report to provide the most comprehensive, timely analysis of energy storage in the US.

Are different energy storage technology systems suitable for different sizes and durations?

Different energy storage technology systems may be suitable for different system sizes and durations, but the reported system cost information represents the approach for which all system variables were kept as similar as possible.

How does energy storage technology affect the adoption of energy storage technologies?

The adoption of an energy storage technology may be impacted by system need and duration. Technologies such as lithium-ion batteries and flywheels can provide shorter duration capacity--from seconds to approximately 4 hours--that is useful for applications like arbitrage and frequency regulation.

What energy storage technologies are used today?

Energy storage technology use has increased along with solar and wind energy. Several storage technologies are in use on the U.S. grid, including pumped hydroelectric storage, batteries, compressed air, and flywheels (see figure).

What is the future of energy storage?

Storage enables electricity systems to remain in balance despite variations in wind and solar availability, allowing for cost-effective deep decarbonization while maintaining reliability. The Future of Energy Storage report is an essential analysis of this key component in decarbonizing our energy infrastructure and combating climate change.

How long do energy storage technologies last?

Energy storage technologies have different uses depending on their durations, which can be from seconds to many days. The adoption of an energy storage technology may be impacted by system need and duration.
