

Energy storage development hot spots

Do research hotspots evolve in underground thermal energy storage?

Existing reviews on underground thermal energy storage (UTES) are often fragmented and lack analysis of the spatial-temporal evolution of research hotspots. This study aims to provide an objective and comprehensive analysis of the developmental trajectory and research trends in the global UTSES field.

What drives energy storage project development?

Globally, energy storage project development is increasingly driven by the utility-scale segment, with mandates and targeted auctions driving gigawatt-hour projects in markets like China, Saudi Arabia, South Africa, Australia and Chile.

Is underground thermal storage a hotspot?

Underground thermal storage primarily depends on geothermal carriers like underground hot rock, hot water, or steam [13,255]. Currently, research on underground thermal energy storage media is exploring materials to enhance energy efficiency: the burstiness index of "PCM" reached 9.12 (post-2020), signifying PCM as the latest hotspot.

What is the energy storage roadmap?

First established in 2020 and founded on EPRI's mission of advancing safe, reliable, affordable, and clean energy for society, the Energy Storage Roadmap envisioned a desired future for energy storage applications and industry practices in 2025 and identified the challenges in realizing that vision.

Why was the energy storage roadmap updated in 2022?

The Energy Storage Roadmap was reviewed and updated in 2022 to refine the envisioned future states and provide more comprehensive assessments and descriptions of the progress needed (i.e., gaps) to achieve the desired 2025 vision.
