Is power rationing a primary mechanism linking high temperatures to productivity losses?

These patterns strongly suggest that power rationing constitutes a primary mechanism linking high temperatures to productivity losses. These findings imply that assessments of climate impacts on firms require explicit consideration of electricity system dynamics.

Is power rationing taking place?

Conversely, if firms' electricity usage is sensitive to the pure electricity supply shock, it implies that power rationing is taking place, indicating that the available electricity supply for firms cannot meet their power demand.

When is power rationing needed?

In other words, when  $R = 1$ , to avoid catastrophic blackouts, the government will enact power rationing to manage the power demand, ensuring that  $E S = N$  and distributing  $N$  between the household and manufacturing sectors. Our model focuses on the particular situation when  $R = 1$  and power rationing is needed.

Does rationing affect firms' electricity usage?

Second, firms' electricity usage exhibits a positive correlation with exogenous power supply variations only when rationing occurs, providing the theoretical foundation for our empirical identification strategy.

Why do we need a co-optimized energy storage system?

The need to co-optimize storage with other elements of the electricity system, coupled with uncertain climate change impacts on demand and supply, necessitate advances in analytical tools to reliably and efficiently plan, operate, and regulate power systems of the future.

Why is power rationing so severe?

This pattern indicates that power rationing becomes particularly severe when heatwaves coincide with constrained hydropower generation capacity. Several alternative explanations that can potentially account for our baseline results and threaten the power rationing channel are excluded.

In addition to power rationing, the government is investing in renewable energy sources, smart grid technologies, and energy storage solutions to create a more robust and sustainable ...

Foreword Stepping up efforts to develop new energy storage technologies is critical in driving renewable energy adoption, achieving China's 30/60 carbon goals, and establishing a new ...

On August 21, the 2025 Annual Management Committee Meeting of the Tsinghua University (State Key Laboratory of Power Systems) - Beijing HyperStrong Technology Co., ...
